Habitat Information

This section requests information regarding the gardens, natural plant communities, and pest management practices of your golf course. This form will provide good “baseline” information that can be used as a measure to determine your course’s capacity to create monarch habitat.

Part I

Please fill out the charts below regarding your gardens and natural plant communities. This should include all blocks of gardens and natural areas on the property that provide significant butterfly habitat.

Gardens	Number	Total Size (~ft ²)
Aesthetic Garden		
Wildlife Garden		
Xeric Garden		
Demonstration Garden		
Total (~ft²)		

Natural Plant Communities	Total Acres	
Deciduous or Mixed Forest Without Understory		
Coniferous Forest Without Understory		
Shrubland/Scrubland		
Mixed Woodland		
Grassland/Prairie/Meadow		
Other (please describe):		
Total Acres		

Part II

- Do you currently choose flowers for gardens or container plants that will provide nectar for butterflies or hummingbirds? YES NO

2. What percentage of current landscape trees, shrubs, flowers, and grasses (excluding turfgrass) are native to your ecological region? _____

3. Do you have any reason to believe that monarch food sources may be contaminated at your course (i.e. from certain types of insecticides)? YES NO

If yes, please explain and provide steps that will be taken to eliminate food source contamination in the future.

4. Do you have any known populations of monarchs at your golf course currently? YES NO
